Grupo Especializado de Didáctica e Historia

# Context and inquiry-based chemistry teaching and learning for engineering students 

## Gabriel Pinto

7-9 JULY 2021 • LJUBLJANA - SLOVENIA * possibility of online participation

## EUROVARIETY 2021

## Outline

- Introduction and goals.
- Case 1: Rate of melting ice cubes in different aqueous solutions.
- Case 2: Emission of $\mathrm{CO}_{2}$ by cars.
- Case 3: Thermochemistry of self-heating beverages.
- Case 4: Why should we use domestic condensing boilers?
- Case 5: Critical analysis of pseudoscientific deceptive information.
- Outcomes.
- "Often students are insufficiently interested by chemistry, because they perceive science education as "irrelevant" both for themselves and for the society".
J. Dillon, Int. J. Envir. Sci. Educ., 4, 201-213 (2009).
- This work is part of a program intended to help teachers include connections between students' daily experiences and chemical topics.
- Idea: by bringing tangible examples we provide opportunities for students to apply science to familiar contexts in hopes that they will appreciate chemistry more and will be motivated and encouraged to study concepts in greater detail.
- I summarize here 5 cases of contextualized open-ended problems / cases carried out with first-year engineering students in the last years, applicable to other educative levels.
- Improve students' (and teachers') motivation.
- Encourage critical thinking skills in students.
- Promote science literacy and social responsibility for the education of students as citizens.
- Facilitate the acquisition of concepts (stoichiometry, conversion factors, thermochemistry...).
- Collaborate on the developing of competencies (problem solving, data analysis, teamwork...).

Real-world problems/cases in Chemistry

## Goals

- Using modern teaching tools: PBL, Interdisciplinary relationships (S-T-S), Team participation, Active learning, Inquiry-based science education (IBSE)...
- Detect misconceptions / alternative conceptions in students.

## Characteristics of suggested activities

- Short class time (< 5 min ), and $\sim 3$ weeks to solve each one.
- Groups of 3 students.
- Account for $10 \%$ of the grade.
- Open results and data mining.
- General rules for students:
- Clearly written (preparation of tables and drawings / graphics).
- Results must be clearly indicated (appropriate units and care in the significant digits).
- Proper citation of references and sites visited.
- Discussion of the activity with the teacher.

## A cyclic process...

OPEN-ENDED
PROBLEM

Stages and characteristics of the methodology of problem solving as an investigation, in: "Introducing Inquiry-Based Methodologies during Initial Secondary Education Teacher Training Using an Open-Ended Problem about Chemical Change", I. Rodríguez-Arteche, M. M. Martínez-Aznar, J. Chem. Educ. 93(9), 1528-1535 (2016).

## Case 1: Ice melting rate in various liquids

## Where will melt before an ice cube in water or in saturated salt water?

| It melts before in: | water | water with salt | practically equal | I don't know |
| :--- | :---: | :---: | :---: | :---: |
| Individual analysis | 8 | 43 | 7 | 2 |
| Group (3 students) | 4 | 48 | 4 | 4 |

Two days after the proposed experimental work...

| It melts before in: | water | water with salt | practically equal | I don't know |
| :--- | :---: | :---: | :---: | :---: |
| 49 said they did | 32 | 14 | 2 | 1 |
| 11 said they did not | 1 | 8 | 1 | 1 |

G. Pinto, P. Lahuerta, Educació Química, 21, 54-62 (2015)

## Other questions:

Why moves one of the ice cubes?
Why water droplets are produced on the outer wall of the vessel?

Do we observe the same if sugar instead of salt is used?

## New experiments...

Time (min)
water
saline solution

Possible further inquiries:

- Is it possible to get a transparent ice cube in the freezer at home?

- What happens if we add an ice cube on cooking oil?
-Why?

## What good is all this?

An important application: understanding of the thermohaline circulation

## Case 2: Relationship between vehicle fuel consumption and $\mathrm{CO}_{2}$ emissions

Gasoline: $\mathrm{C}_{8} \mathrm{H}_{18}+\mathbf{1 2 . 5} \mathrm{O}_{\mathbf{2}} \rightarrow \mathbf{8} \mathrm{CO}_{2}+\mathbf{9} \mathrm{H}_{\mathbf{2}} \mathrm{O}$

$$
\begin{array}{r}
\mathrm{CO}_{2} \text { emission }=\frac{\text { Octane consumption }(\mathrm{L} / 100 \mathrm{~km})}{100 \mathrm{~km}} \cdot 0.75 \frac{\mathrm{~kg}}{\mathrm{~L}} \cdot \frac{1 \mathrm{kmol} \text { octane }}{114.22 \mathrm{~kg}} \cdot \frac{8 \mathrm{kmol} \mathrm{CO}_{2}}{\mathrm{kmol} \text { octane }} . \\
\left.\cdot \frac{44.01 \mathrm{~kg}}{\mathrm{kmol} \mathrm{CO}_{2}} \cdot 10^{3} \frac{\mathrm{~g} \mathrm{CO}_{2}}{\mathrm{~kg}}=23.1\left(\mathrm{~g} \mathrm{CO}_{2} / \mathrm{L} \cdot \mathrm{~km}\right) x \text { Octane consumption (Lin } 100 \mathrm{~km}\right) \\
\text { M. T. Oliver-Hoyo, G. Pinto, J. Chem. Ed., 218-220 (2008) }
\end{array}
$$

## Case 3: About self-heating beverage containers

There are commercial products that claim to heat their contents based on the dissolution process of a salt or on a chemical reaction.

M. T. Oliver-Hoyo, G. Pinto, J. A. Llorens, J. Chem. Ed., 86, 1277-1280 (2009)
G. Pinto, M.T. Oliver-Hoyo, J. A. Llorens, J. Chem. Ed., 86, 1280A-1280B (2009)
M. Prolongo, G. Pinto. Educació Química, 7, 4-14 (2010)
a. Describe the container and the chemical reaction.

$$
\mathrm{CaO}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightarrow \mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})
$$

b. Calculate excess / limiting reactants and the mass of product that can be formed.

CaO: 1.07 mol (limiting)
Excess of 0.21 mol water ( $\mathbf{3 . 7 8} \mathbf{~ g}$ ); thus, it could be $79.29 \mathrm{~g} \mathrm{Ca}(\mathrm{OH})_{2}$
c. Search (different sources) the values of $\Delta_{\mathrm{f}} \mathrm{H}^{\circ}$ and present them in a table.

|  | $\Delta_{\mathrm{f}} \mathrm{H}^{\circ}$, at 298 K and 1.00 atm, kJ/mol |  |  |
| :--- | :---: | :---: | :---: |
| Substance | Source 1 | Source 2 | Source 3 |
| $\mathrm{CaO}(\mathrm{s})$ | -635.09 | -635 | -635.09 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | -285.83 | -286 | -285.8 |
| $\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s})$ | -985.14 | -987 | -986.09 |

d. Calculate the heat ( $\mathrm{kJ} / \mathrm{mol}$ ) evolved.

$$
\Delta \mathrm{H}^{\mathrm{o}}=-985.14+635.09+285.83=-\mathbf{6 4 . 2 2} \mathbf{k J} / \mathbf{m o l}
$$

e. Prepare a table with end temperatures and compare them.
$1,07 \mathrm{~mol} \cdot 64.22 \mathrm{~kJ} / \mathrm{mol}=68.72 \mathrm{~kJ} \equiv 16.42 \cdot 10^{3} \mathrm{cal}$
$\mathrm{Q}=\mathrm{m} \cdot \mathrm{C} \cdot \Delta \mathrm{T} \Rightarrow \Delta \mathrm{T}=67.2^{\circ} \mathrm{C}$

| Procedure | End temperature $\left({ }^{\circ} \mathrm{C}\right)$ |
| :--- | :---: |
| Experimental | 62.8 |
| According to manufacturer | 62.5 |
| Calculated (theoretical) | 89.7 |

g. Identify and discuss the assumptions made.
h. Comment on advantages/disadvantages and suggest ways to improve these cans.

i. Comment on any interesting aspect of this activity (possibility to cool beverages, instructions, additional information...).

## Case 4: Termochemistry and condensing boilers

There is a known "Plan Renove" for domestic boilers in Spain, that is part of the "Action Plan for Energy Saving and Efficiency" developed for promoting the use of "condensing boilers".

a. Through suitable sources, collect in a table a typical composition of natural gas expressed as $\%$ vol. and mole fraction.

> - Confusion substance / element / hydrocarbon.

- Sum of $\% \neq 100 \%$

| Substance | Formula | Composition |  |
| :--- | :--- | :--- | :--- |
|  |  | \% Vol | Molar faction |
| Methane | $\mathrm{CH}_{4}$ | $87.0-96.0$ | $0.870-0.960$ |
| Ethane | $\mathrm{C}_{2} \mathrm{H}_{6}$ | $1.5-5.1$ | $0.015-0.051$ |
| Propane | $\mathrm{C}_{3} \mathrm{H}_{8}$ | $0.1-1.5$ | $0.001-0.015$ |
| Isobutane | $\mathrm{C}_{4} \mathrm{H}_{10}$ | $0.01-0.3$ | $0.0001-0.003$ |
| Butane | $\mathrm{C}_{4} \mathrm{H}_{10}$ | $0.01-0.3$ | $0.0001-0.003$ |
| Isopentane | $\mathrm{C}_{5} \mathrm{H}_{12}$ | Traza-0.14 | Traza-0.0014 |
| Pentane | $\mathrm{C}_{5} \mathrm{H}_{12}$ | Traza-0.14 | Traza-0.0014 |
| Nitrogen | $\mathrm{N}_{2}$ | $0.7-5.6$ | $0.007-0.056$ |
| Carbon dioxide | $\mathrm{CO}_{2}$ | $0.1-1.0$ | $0.001-0.010$ |
| Oxygen | $\mathrm{O}_{2}$ | $0.01-0.1$ | $0.0001-0.001$ |
| Hydrogen | $\mathrm{H}_{2}$ | Trace-0.02 | Trace-0.0002 |

G. Pinto, Educació Química, 14, 29-38 (2013).

## b. Create a table with the composition of a 'model'

natural gas, considering only the two major hydrocarbons.

| Substance | Composition |  |
| :--- | :---: | :---: |
|  | Molar fraction | \% Wt. |
| Methane | 0.850 | 75.1 |
| Ethane | 0.150 | 24.9 |

- Examples: 86.75 and 13.25 .
- Some students copy wrong data from peers, changing only one hundredth.
c. Consulting adequate sources, provide a table where data with $\Delta_{\mathrm{f}} \mathrm{H}^{0}$ $(\mathrm{kJ} / \mathrm{mol})$ for gases of previous section and for $\mathrm{CO}_{2}(\mathrm{~g}), \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ y $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$.

|  | $\Delta_{\mathrm{f}} \mathrm{H}^{\mathrm{o}}(\mathrm{kJ} / \mathrm{mol})$ |  |  |
| :--- | :--- | :--- | :--- |
| Substance | Source 1 <br> $(298,15 \mathrm{~K} \mathrm{y} \mathrm{1} \mathrm{bar)}$ | Source 2 <br> $(298 \mathrm{~K} \mathrm{y} \mathrm{1} \mathrm{atm})$ | Source 3 <br> $(298$ K y 1 bar) |
| $\mathrm{CH}_{4}(\mathrm{~g})$ | -74.6 | -74.9 | -74.9 |
| $\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})$ | -84.0 | -84.7 | -83.7 |
| $\mathrm{CO}_{2}(\mathrm{~g})$ | $-393.51 \pm 0.13$ | -394 | -393.509 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ | $-241.826 \pm 0.040$ | -242 | -241.818 |
| $\mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ | $-285.830 \pm 0.040$ | -286 | -285.830 |

- Sometimes wrong value or sign.
d. Calculate $\Delta \mathbf{H}^{\mathbf{0}}{ }_{\text {comb }}(\mathrm{kJ} / \mathrm{mol})$ of natural gas, at $25^{\circ} \mathrm{C}$, assuming that the water is obtained as gas.

$$
\begin{array}{ll}
\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & \Delta \mathrm{H}^{\mathrm{o}}=-803 \mathrm{~kJ} / \mathrm{mol} \\
\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})+7 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{CO}_{2}(\mathrm{~g})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) & \Delta \mathrm{H}^{\mathrm{o}}=-1429 \mathrm{~kJ} / \mathrm{mol} \\
\hline
\end{array}
$$

$$
0,85 \cdot(-803 \mathrm{~kJ} / \mathrm{mol})+0,15 \cdot(-1429 \mathrm{~kJ} / \mathrm{mol})=\mathbf{- 8 9 7} \mathbf{k J} / \mathbf{m o l}
$$

- $\mathrm{CH}_{4}(\mathrm{~g})+\mathrm{C}_{2} \mathrm{H}_{6}(\mathrm{~g})+11 / 2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})+5 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \quad \Delta \mathrm{H}^{\mathrm{o}}=-2229,1 \mathrm{~kJ} / \mathrm{mol}$
- $\mathrm{CH}_{4}(\mathrm{~g})+4 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{g}) \quad \Delta \mathrm{H}^{\mathrm{o}}=-803 \mathrm{~kJ} / \mathrm{mol}$ (goes well) [sic.]
- Some students compared with values of $\Delta \mathrm{H}^{\circ}$ comb from Handbook.
e. Repeat calculation by assuming that the water is obtained as liquid.

$$
0,85 \cdot(-891 \mathrm{~kJ} / \mathrm{mol})+0,15 \cdot(-1561 \mathrm{~kJ} / \mathrm{mol})=\mathbf{- 9 9 2} \mathbf{k J} / \mathbf{m o l}
$$

- A group: "It is due to condensation of water, i.e.: $\mathrm{H}_{2}+1 / 2 \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O}$ " [sic.]
f. Determine the quantity of natural gas that should be used, in a condensing boiler, per each mole of natural gas that should be used in the other boiler, in order to obtain the same energy. Discuss economic and social implications.

$$
\begin{aligned}
& \frac{897 \mathrm{~kJ} / \mathrm{mol} \text { gas conventional boiler }}{992 \mathrm{~kJ} / \mathrm{mol} \text { gas conden. boiler }}= \\
& \quad=0.904 \text { mol gas condens. boiler / mol gas conventional boiler }
\end{aligned}
$$

- Values by students: 0.90-0.91 mol gas condens. boiler / mol gas conventional boiler.
- Comments on the greenhouse effect.
- "It reduces the consumption of natural gas (non-renewable energy source)".
- "Impacts not only the user, but in the country: facilitates the use of gas for future generations".
g. Discuss if the condensate water in the condensing boiler is acid or alkaline.

$$
\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{ac}) \leftrightarrows \mathrm{HCO}_{3}^{-}(\mathrm{ac})+\mathrm{H}^{+}(\mathrm{ac})
$$

- pH between 3 and 5 (technical problems in drainage).
- "It isn't too acidic, because carbonic acid is weak" [sic.].
h. Itemize the assumptions made in your calculations.
- A 'model' composition and normal conditions were assumed.
- Combustion gases go out at $150-180{ }^{\circ} \mathrm{C}$ (conventional) and $\sim 55^{\circ} \mathrm{C}$ (condensing).

1. Discuss any aspect of interest (additional data, sustainability, environment, need to subsidise it, obtaining natural gas ...).

- Fuel Savings / $\mathrm{CO}_{2}$ emission reduction.
- Operation of boilers (combustion, heat exchanger, drainage, smokestack ...).
- Quantity of condensed water.
- Fracking (hydraulic fracturing).

- "At first it is more expensive, but energy is better utilized."
- "The data show that it is very convenient, economically and ecologically, to use condensing boilers and given the high price, a subsidy is usually necessary."

## Summative analysis of the homework (GOAL problem-solving protocol was recommended).

## GOAL

- Gather information about the problem.
- Organize the information.
- Analyze the problem.
- Learn from your effort.

See: http://www.phyast.pitt.edu/~ak12/Phys0174/info/tips/problem_solving.html Prof. Adam Leibovich, University of Pittsburgh

- "We liked the activity for learning to use the strategy GOAL, being a good problem-solving method that will be useful in other subjects".
- "It has not been easy, but the effort was worth learning and we remembered basic concepts".
- "It was a different homework to what we are used to, entertaining and helpful to understand certain topics studied in the classroom".
- "It has helped us deepen concepts ...".
- "Theoretical data are not equal to the experimental".

## Case 5: Critical analysis of pseudoscientific deceptive information

## Flaska

Your Personal Waterspring
Flaska glass products are programmed using the TPS procedure, therefore the structure of the water in them changes and becomes similar to the structure of spring water.

Dr. Masaru Emoto
The photograph taken in the Dr. Masar
Emoto Laboratory in Japan, shows t
water crystal from Flaska.

This is why we should:
01 Drink plenty of waterAdults should drink at least 2L per day.

02 Drink high-quality waterCheck the quality of the water you are drinking with your supplier. If it is not adequate, you should take steps to improve its quality with a good filtration system.

03
Changed structure of waterThe vibrational structure of water is disrupted in artificial environments, which affects its quality and taste. Drink restructured water, you will love the taste.

04 For the best experience

- Pour water into Flaska;
- wait for five minutes;
- shake your Flaska - water loves movement
- take your time and drink consciously,
- feel the water!

The `secret': this kind of glass is made with $\mathrm{SiO}_{2}$

## Students' point of view

- This kind of exercises helps us understand better the world around us.
- Makes chemistry a tangible experience so that it is not only solving problems on a piece of paper.
- It shows chemistry is not only formulas and is valuable for something.
- Chemistry is very boring, any tool to make it more interesting is worth the try.
- My chemistry teacher said that "chemistry is everything", and this helped me to see why.
- It serves to relate concepts of chemistry with products we can easily find.
